TITLE

A study on the Perceived
health (status) and health care
Practices of Elderly Persons of
Bedilious Road Area of West
Bengal Howrah - 701102

Preface

This field work has been given by our Anthropology department of Bangabashi Morning College which is under our Calcutta University. This field work is given by our H.O.D professor pransanjit Sarkar and professor chuma shekhar to the students of 5th Semester. This field work is for our practical Examination.

Acknowledgement

I would like to express my special thanks of gratitude to my teacher prof. prasanjit Sarkar, chamo sherpa & Amita Mazumder.

Who gave me the golden opportunity to do this wonderful project and field work. Who also helped me in completing my project. I came to know about so many new things I am really thankful to them.

Secondly I would also like to thank my parents and friends who helped me a lot in finalizing this field work within the limited time frame.

Aniket Prasad.

5th Semester

Introduction

Anthropology is the scientific study of humanity, concerned with behavior, human biology, cultures, societies, and linguistics, in both the present and past, including past human species.

Social anthropology studies patterns of behavior, while cultural anthropology studies cultural meaning, including norms and values. A postmodern term sociocultural anthropology is commonly used today. Linguistic anthropology studies how language influences social life. Biological or physical anthropology studies the biological development of human.

Biological Anthropology :-

Biological Anthropology (also referred to as physical anthropology) is the subfield of anthropology concerned with humans as a biological species. As such, it is the subfield most closely related to the natural sciences. Biological anthropologists conduct research to understand both human evolution and modern human variation. The investigation of human evolution presents one of the most tantalizing areas of anthropological study.

Archaeology:-

Archaeology, the branch of anthropology that examines the material traces of past societies, informs us about the culture of those societies — the shared way of life of a group of people that piles, or middens, to discover how members of past societies ate their meals, what tools they used, and what beliefs gave meaning to their lives.

Linguistic Anthropology:-

Linguistics, the study of language, has a long history that overlaps with the discipline of philosophy, but is also one of the integral subfields of anthropology. Linguistic anthropology focuses on the relationship between language and culture, how it is acquired and used. Linguistic anthropologists seek to discover the ways in which languages are different from one another, as well as how they are similar. Two wide-ranging areas of research in linguistic anthropology are structural linguistics and historical linguistics.

Cultural Anthropology :-

Cultural Anthropology is the subfield of anthropology that examines contemporary societies and cultures throughout ~~over~~ ~~from~~ the world. Cultural anthropologists do research the world over, from tropical rainforests to the first professional Cultural anthropology focused on non-western cultures in Africa, Asia, the Middle East, Latin America, and the Pacific Islands and on the Native American populations in the United States. Today, however, many cultural anthropologists have turned to research on their own societies in order to gain a better understanding of their institutions and cultural values.

Cross - Checking of data

Data Collection: -

Data are collected at the best of fieldwork they are largely based on our sense - observations. The word observation in the context of data collection, includes all forms of sense perceptions used a datum. "A datum is what is observed," is manifest or phenomenal. I look for the facts by observing the people carefully. I try to understand the themes of every behaviours. Being and observer, one should keep myself apart from the struggle of the community. There are supposed to be certain limitation for me. No confidential information can be gather in this way. at present I most of the supplement their 'observation' by the methods of interview. The collected data is purely avaiatative in nature.

- * Primary data :- Primary data are those which are collected afresh for the first time and thus happen to be original in character. Eyewitness events are taken into account.
- * Secondary data :- Secondary data are those which already been collected by someone else and such data, are generally processed data. He say evidences are also collected here.
- * Qualitative data :- Qualitative data is the descriptive and conceptual finding collected through questionnaires, interviews, or observation. Its describing the attributes or properties than an object possesses.
- * Quantitative data :- Quantitative data that can be counted or measured in numerical values. Examples, Height in feet, age, in years, and weight in pounds are quantitative data.

Scope of study

The present study is an attempt to understand dimensions of life satisfaction and quality of life among elder persons of different places. The data is collected from 25 elderly living in different places of West Bengal. The results of the study reveal that elderly describe their life satisfaction in terms of financial self-sufficiency, food habits, affordable treatment, affinity habit with their health conditions.

Health and well being are important aspects of ageing. Disability among the older population in India is high. The mean WHODA score of 71.3 is lower (in this score lower indicates worse health) than any of the five countries (China, Ghana, Mexico, Russia, South Africa) that have similar data. Also, nearly 90% of the old reported suffering from at least one disability. Disability and poor health in old age in India is because of the double burden of communicable and non-communicable disease. This is unlike ageing population in developed countries where communicable diseases are not a major risk factor. The burden of disease

(8)

In old age is further worsened by high rates of smoking and other life style factors. As with other aspects of ageing, there are important differences in health status by gender, economic status, dependency level, marital status and living arrangements of the elderly.

After statistically calculating sample of 25 older persons (OPs) through randomly interviewed by taking their verbal consent after introducing them about objective of study. Structured question naire was development for data collection purposes. Data was entered in structured formatted paper and analyzed by manually through pie charts in project paper.

Materials and methods -

Current study was conducted in ~~Barrow~~ Howrah (beliti-
one lane) and a sample of 25 was interviewed to
satisfy the study requirement. Structured manually
interview was implemented to collect data i.e. by
questioning. Every participant was fully informed about
the objectives of study and was assured that their
name will be kept secret, and only relevant informat-
ion will be disclosed in data. And after getting their
a verbal consent information was gathered. Data
entry was done in a data sheet and analyzed by me
to test the results.

Results

Response	Frequency	Percent
60-64	2	8.00
65-69	13	52.00
70-74	5	20.00
75-79	3	12.00
80-84	2	8.00
85-89		
90+		
Total	25	100.00

Table 1 - Age Distribution of the Respondents.

To satisfy the requirement topic age of every individual starting from 60 years to onwards. Among 25 respondents 8% were fall under the category of 60-64 year of age, participation from 65 to 69 years age group was 52%, 20% were fall under the category of 70-74 years of age, participation from 75 to 79 years age group was 12%. Percentilis also depicts the 87% of the respondents were belong to 80 and above years of age.

Old Age is	Frequency	Percent
Illness and disease	23	92.00
Stress and depression	1	4.00
social isolation and ignorance	1	4.00
Increased dependency		
less social participation		
Poor physical and mental health		
Total	25	100.00

Table-11. what do you think about an old age

(11)

Table-II exploring the concepts of older persons about old age on the might say table. Depicts the different perceptions of OPs about age being an older person. In 92% cases OPs were of the view that old age is the name of illness and disease, and social isolation and ignorance with 4%, and stress and depression with 4%.

Response	Frequency	Percent
Hypertension	11	44.00
Heart Problems	1	4.00
Diabetes	3	12.00
Arthritis	1	4.00
Asthma	2	8.00
Other	6	24.00
NA/No diseases	1	4.00
Total	25	100.00

In 44% cases respondents reported hypertension, in 4% cases heart problem is recorded, 12% of OPs were diabetic, 4% and 8% complained about arthritis and asthma respectively and 24% were reported other disease like TB, Hepatitis and psychological issues etc.

Findings :-

Ageing is global issue with all its impact and consequences as observed. This research focused is collect the opinion of OPs about what they perceived about old age. Concepts were constructed and developed not only by an individual but society and cultural values also played their role in this scenario. It is true that the image of OPs in developed and modern world is fading; studies were more focused in the concept of the image of ageing and deliberate this to be significant in the concept of the image of and prosperity of older people as explained by Tobin (1999). Fischer et al, (2008) further explains that growing old is now defined as "maintaining one's identity in spite of the changes that come with ageing and, enhancing opposites -

study finding unveils that respondents consider old age as illness and disease, life as stress and depression, increases social isolation respectively.

Theoretical paradigm in ageing is normally covered by Activity theory, Disengagement theory and Continuity theory. Continuity theory is explained that it is active to be inactive, we may explain this that if someone want to enjoy a successful old age then he should contribute in different socio-cultural and political activities but if he did not able to maintain an active status this means he will not able to sustain an active person role in old age. While disengagement theory is concerned with to leave social-cultural responsibilities either by willingly or by forces and on the other hand continuity theory explain that successful ageing is only achieved by continuing post life style. But unfortunately all these school of thoughts not proved these theories by using empirical or historical evidences as reported by Fiopoulos (2010), Moody (2010) and Takloski (2006).

Different social and cultural forces help to develop the concept about old age. As Irwin explain that researcher from different disciplines and having to a range of diverse view points explained development were reported to place ops at the corner of.

Society, as different modes of socio-cultural exclusion and at high risk of poverty. These factors contributed to develop negative stereotypes among elders about old age. Processing of ageing, historic changes and the ordering of life development divisions in work society all appear as dominant factors which marginalize or, isolated them from centers of power and of knowledge.

Bengtson et. al. (1975) explain the development of stereotypes by using data from a relative research of 5450 young adults in 6 developing countries and come up with parallel findings that social change was associated to negative perceptions of ageing. One of the previous studies depicts a view point that ageing can affect other individual's described wish to live. point that ageing can affect other individuals they were importantly more likely to reject life extending health treatment in supposed situations, where as those in the positive stereotype group were in supposed situations, where as those in the positive stereotype group were significantly more likely to accept life prolonging medical treatments.

Table 1 - Distribution of population on the basis of Sex.

Age \ Sex	Male	Total	Total Percentage
60-64	IIII (4)	4	26.66 %
65-69	IIII (4)	4	26.66 %

Age vs Sex distribution table for female

Observations - from the data of table 1

Increase of Male :-

- from 60 to 64 range male we get only 4 males
- from 65 to 69 range male we get that there are 4 males.
- from 70 to 74 range male we get only 1 male
- from 75 to 79 range male we get that there are 3 males.
- 80-84 range male we get only 1 male
- 85-89 range male we get that there are 2 males.
- So, by observing we get that there are 15 males among 25 people.

Increase of female :-

- from 60 to 64 range female we get that there are 4 females
- from 65 to 69 range female we get that there are 4 females
- from 70 to 74 range female we get that there are only 1 female.
- from 75 to 79 range female we get that only 1 female.
- So, by observing we get that there are 10 females among 25 people.

Age vs Marital status distribution table for female

Observations from the data of table 2

In case of Male:

- From 60-64 range male we get that there are 3 Married 1 Unmarried male.
- From 65-69 range male we get that there are 4 Married,
- From 70-74 range male we get only one 1 Married
- From 75-79 range male we get only two 2 Married, 1 widower.
- From 80-84 range male we get only 1 married
- From 85-89 range male we get only 2 married.
- From 90+ range male we get 2 married.
- So, by observing we get that among 25 people 13 male people 1 Unmarried 1 widower.

In case of female:

- From 60-64 range female we get 4 married.
- From 65-69 range female we get 2 married, 1 Unmarried, 1 widower.
- From 70-74 range female we get only 1 Married.
- 75-79 range female we get only 1 Unmarried.
- So, by observing we get that among 25 people 7 female people married 2 Unmarried 1 widower.

Age vs requirement of medicine distribution table for female

Observation from the data of table 5

In Case of Male :-

- From 60-64 range male we get 1 required medicine, 3 not required
- From 65-69 range male we get 4 required medicine.
- From 75-79 range male we get Only 1 required medicine
- From 80-84 range male we get only 2 required medicine
- From 85-89 range male we get only 1 required medicine
- From 90+ range male we get only 2 required medicine
- So, by observing we get that among 25 people 15 male require medicine.

In Case of Female :-

- From 60-64 range female we get 4 required medicine
- From 65-69 range female we get 4 required medicine
- From 70-74 range female we get 1 required medicine
- From 75-79 range female we get 1 required medicine
- So, by observing we get that among 25 people 10 females require medicine.

Age vs Food Preferences distribution table for female.

Observation from the data of table 6

In case of Male :-

- From 60-64 range male we get that only 4 non-vegetarian
- From 65-69 range male we get that 2 veg and 2 non veg.
- From 75-79 range male we get that only 1 non-veg
- From 80-84 range male we get that 3 non veg
- From 85-89 range male we get that only 1 non veg.
- From 90+ range male we get that only 2 non veg.
- So, by observing we get that among 25 people 3 male are vegetarian and 12 males are non vegetarian i.e. 15 Male are there.

In case of female :-

- From 60-64 range female we get 2 ~~veg~~^{veg} and 2 non-veg
- From 65-69 range female we get 1 veg and 3 no-veg
- From 70-74 range female we get only 1 vegetarian
- From 75-79 range female we get only 1 vegetarian
- So, by observing we get that among 25 people there are total 4 vegetarians and 6 non vegetarians i.e. 10 female are there.

EXAMINATION
DEPARTMENT OF ANTHROPOLOGY
BANGALORE MORNING COLLEGE
DATE

Observation from the data of table 7

In case of Male :-

- From 60-64 range male 2 Regular exercise, 3 physical exercise.
- From 65-69 range male 3 physical exercise 1 No Activity.
- From 70-74 range male 1 No Activity
- From 75-79 range male 3 No Activity
- From 80-84 range male 2 no Activity
- From 85-89 range male 1 no Activity
- From 90+ range male we get that 1 no Activity.
- So, by observing that we get that among 25 people 8 physical exercise, 1 Regular exercise, 6 male are no activity. i.e total 15 male are there.

In case of Female :-

- From 60-64 range female we get 4 physical exercise
- From 65-69 range female we get 2 yoga, 1 physical, 1 No
- From 70-74 range female we get only 1 physical exercise
- From 75-79 range female we get only 1 physical exercise
- So, by observing that we get that among 25 people 2 regular exercise, 6 physical exercises, 1 yoga And last one 1 is No Activity i.e total 10 female are there.

90+												
Total										10	10	100%

Age vs habituated distribution table for female

Observations from the data of table 8

In case of Male :-

- From 60-64 range male 1 Smoking, 1 consuming liquor, 2 No Activity
- From 65-69 range male 1 chewing betel nut, 1 tobacco, 2 No.
- From 75-79 range male Only 1 No. zero habituated.
- From 80-84 range male 3 Smoking person.
- From 85-89 range male Only 1 chewing betel nut.
- From 90+ range male we get Only 2 tobacco.
- So, by observing we get that 4 people have Smoking habit 1 consuming liquor and 1 tobacco 5 No zero habit. Activity i.e total 15 people among 25 people.

In case of female :

- From 60-64 range female we get 4 zero affinity
- From 65-69 range female we get 4 zero affinity
- From 70-74 range female we get 1 zero affinity
- From 75-79 range female we get 1 zero affinity
- So, by observing we get that 10 female have no zero affinity habit i.e total 10 female among 25 people.

85-89									
90+									
Total		2	7			1		10	100.00%

Age vs type of medicine used distribution table for female

Observation from the data of table 9

In Case of Male :-

- From 60-64 range male 1 prefer Allopathy, 2 Any other, 1 No.
- From 65-69 range male 1 prefer homeopathy, 3 Allopathy
- From 75-79 range male 1 prefer to Allopathy
- From 80-84 range male 1 homeopathy, 2 allopathy, 1 No.
- From 85-89 range male 1 allopathy prefer.
- From 90+ range male prefer to 2 allopathy.
- So, by observing we get that 2 Homeopathy and 9, allopathy, 2 any other, 2 No medicine. i.e total 15 people among 25 people

In Case of Female :-

- From 60-64 range female prefer to 4 Allopathy
- From 65-69 range female 1 Homeopathy, 2 allopathy, 1 No.
- From 70-74 range female prefer to 1 Homeopathy
- From 75-79 range female prefer to 1 Allopathy.
- So, by observing we get that 2 Homeopathy, 7 allopathy, 1 any other medicine. i.e total 10 people female among 25 people of female.

Case study

Study - I

Name : Shankar Shaw
Age : 68
Sex : Male
Address : Howrah (Belilious Road)
Occupation : Plumber worker
Education : 9th Pass out
Influents : Joint family

History of present health

- Patient has history of cough and cold for 4 months and back, joints pain since 2 years.
- Diabetes under insulin therapy
- Facing problems during walk and exercise.

History of past health

- Past health was good but now that person is facing difficulties their health some months.

Condition (family history)

- Patients family is good and supporting their health help with every thing (medicine, money, care etc.)
- Middle class family

EXAMINATION
DEPARTMENT OF ANTHROPOLOGY
BANGALURU UNIVERSITY COLLEGE

Personal history

- Smoking : No
- Alcohol : No
- chewing betel nut : yes
- Food habit : In ~~the~~ week they consume non-veg
Only 2 day.
- Sleeping pattern : 8 hours at night.

Case study - II

Name - Santi Devi

Age - 72

Sex - Female

Address - Howrah (Bellious Lane).

Education - 5th passed

Occupation - Home wife.

Influents - join family

History of present health

- Patient presented to emergency room with ~~fever~~ visual fever since 5 days.
- Some problem is breathlessness since 5 days and history of visual fever with 5 caught 4 days ago.

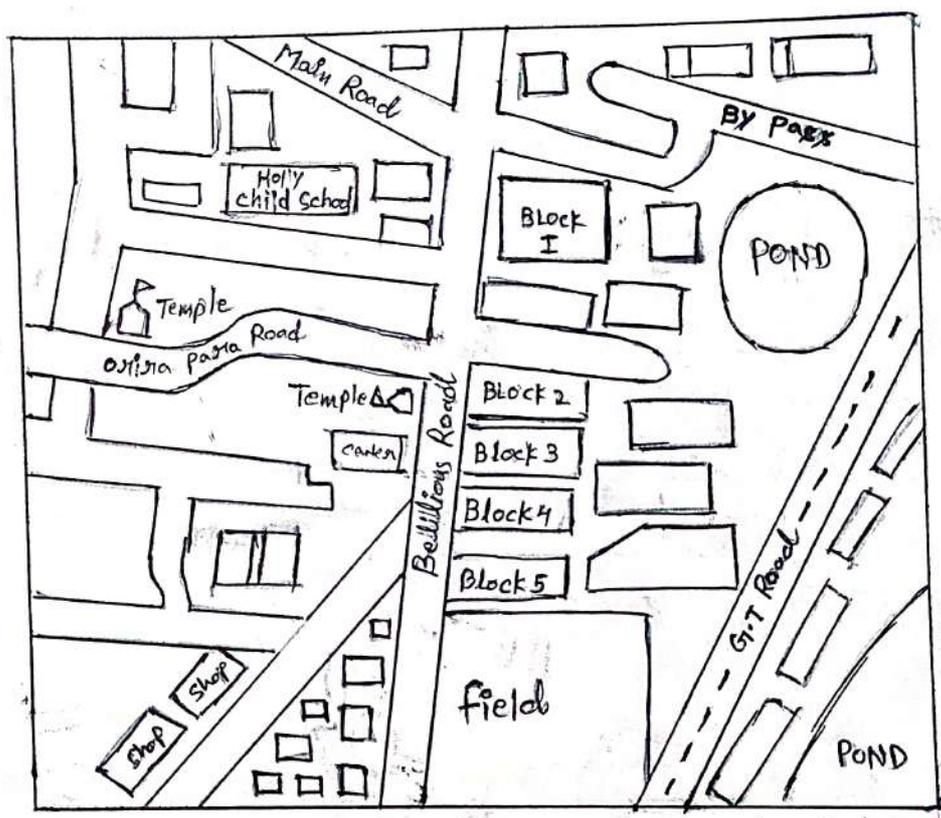

Family history Condition

- The patient who is suffering from that disease not can not able to take care by herself as she is very elder woman and her financial condition is not very good. Due to this reason she is suffering from common ~~illness~~ illness in her day to day life.
- Middle class family.

Personal history

- Smoking : No
- Sweet pain : yes
- food habit : In a week she consume vegetarian food and pulses as she a vegetarian.
- Sleeping pattern : 6 hours at night.
- awake Time : She wakes up early 4 A.M in the early morning.
